$$+ \frac{g}{2} |\Phi|^4$$

Helmholtz equation

$$[\nabla^2 + \beta^2(\omega)] \tilde{\mathbf{E}}(\mathbf{r}, \omega) = \mathbf{0}$$

$$i\partial_z \Phi(x, y, z, t) = \left[-\frac{1}{2}(\partial_x^2 + \partial_y^2 + \partial_t^2) + W(x, y) + g|\Phi(x, y, z, t)|^2 \right] \Phi(x, y, z, t)$$

Formally analogous to GPE within

$$\mathcal{L} = \frac{i}{2}(\Phi^* \partial_z \Phi - \Phi \partial_z \Phi^*) - \frac{1}{2}(|\partial_x \Phi|^2 + |\partial_y \Phi|^2 + |\partial_t \Phi|^2) - \underbrace{W(x, y)}_{\text{harmonic external potential}} |\Phi|^2 - \underbrace{\frac{g}{2} |\Phi|^4}_{\text{Kerr nonlinearity}}$$

variational ansatz

$$\Phi_{nm}(r, \theta, z, t) = A_{nS}(z, t) T_{nS}(r; \sigma_{nS}(z, t)) e^{im\theta}$$

Laguerre-Gauss modes

$$\begin{matrix} A_{nS}(z, t) \\ \sigma_{nS}(z, t) \end{matrix}$$

variational parameters

Dimensional reduction
(3+1)-D → quasi (1+1)-D

$$i\partial_z A = -\frac{1}{2}\partial_t^2 A + \xi_{pS} \left(\frac{1 + (3/2)g_{pS}|A|^2}{\sqrt{1 + g_{pS}|A|^2}} \right) A$$

$$\sigma^4 = 1 + g_{pS}|A|^2 \quad \text{Nonpolynomial Schrödinger equation}$$

analytical (implicit) solitonic solutions

stability estimate through Vakhitov Kolokolov criterion
